cal symplectic or Floer homology of an isolated closed orbit (non-constant in the Hamiltonian case); see Proposition 221 and Corollary 37 Applying

the Lusternik–Schnirelmann theorem to Reeb flows on the standard contact S^{2n-1} and ST^*S^n , we obtain sequences of closed Reeb orbits with strictly

Orbit Control at Synchrotron Light Sources

tron beam orbit is critical for achieving design goals in these machines A review of closed orbit control will be given, including an overview of the sources of orbit motion, a description of closed orbit correction and feedback algorithms, and a discussion of the pitfalls and limitations of orbit control Illustrative examples from light sources

Relative motion of orbiting bodies

hard to reconcile with common sense and our everyday experience In this paper we discuss the problem of passive relative motion of orbiting bodies on the specific example of the free motion of any body that is ejected from the orbital station that stays in a circular orbit
